

SwiftGY — App Features & Codebase Audit

Westbridge Inc. · Guyana's multi-service delivery platform · built on the open-source Enatega foundation

What this is

An honest audit of the actual SwiftGY code (repos: swiftgy-frontend, swiftgy-backend) and a full feature list. The platform is React Native (Expo) + TypeScript on the frontend and Node + GraphQL + MongoDB on the backend — not Swift. It is a fork of Enatega (MIT-licensed), already rebranded to SwiftGY and themed for Guyana (currency GYD / G\$, country +592, regions Georgetown / Linden / New Amsterdam).

The five apps you already have

App	Who uses it	Folder
SwiftGY (Customer)	Customers ordering food/groceries/items (iOS & Android)	enatega-multivendor-app
SwiftGY Rider	Delivery riders accepting and fulfilling orders	enatega-multivendor-rider
SwiftGY Vendor	Restaurants / stores managing menus and orders	enatega-multivendor-store
SwiftGY Web	Customer web ordering (Next.js)	enatega-multivendor-web
SwiftGY Admin	You: manage vendors, riders, orders, config (Next.js)	enatega-multivendor-admin

Features that ALREADY EXIST (confirmed in code)

Customer app

Restaurant & store browsing, menus, item detail with add-ons/options, search, favourites, cart, checkout, reorder, multiple saved addresses with map pin, current-location detection, order placement & live order tracking, chat-with-rider, ratings & reviews, coupons/discounts, profile, help, phone + OTP login. Payment screens for Stripe and PayPal exist.

Rider app

Availability toggle, assigned orders, order fulfilment flow, earnings / withdrawn-amount tracking, withdraw requests.

Vendor app

Menu / food / category management, incoming orders, store profile.

Admin dashboard

Manage restaurants/vendors, riders, orders, zones (delivery areas), banners, coupons, configuration (currency, delivery rate), dashboard analytics.

Backend (data models)

User, Vendor, Restaurant, Rider, Order, Food, Category, Addon, Option, Coupon, Banner, Review, ChatMessage, Zone, WithdrawRequest, Configuration. GraphQL API with real-time subscriptions (websockets), JWT auth, Firebase push, Cloudinary image upload, email (nodemailer), Redis.

TWO CRITICAL FINDINGS for your business model

Finding 1 — The app is built COMMISSION-based, not flat-fee.

The Restaurant model has **commissionRate (default 15%)**. This is the exact OPPOSITE of your flat-weekly-fee model. Stock Enatega assumes the platform takes a % cut of every order. Your whole differentiator — "pay a flat weekly fee, keep 100%" — **does not exist in the code** and must be built. There is no weekly billing, no subscription plan, no auto-suspend. This is the single most important gap: it is literally how you make money.

Finding 2 — Cash is the default payment, but only as a label.

The Order model defaults paymentMethod to **'COD'** (cash on delivery) and tracks paymentStatus PENDING/PAID/FAILED — so the concept of cash exists. But there is **no real cash reconciliation flow** and no Caribbean payment rail (no PowerTranz/FAC/WiPay, no MMG). The built-in payment integrations are Stripe and PayPal, whose availability in Guyana you still need to verify. So payments need real work for your market.

What's MISSING vs your original vision

Feature you wanted	In code?	Reality
Food delivery	YES	Fully built
Groceries / supermarkets	YES	Supported as vendor type
Restaurants	YES	Core of the platform
Riders / couriers (delivery)	YES	Full rider app
P2P courier (send A to B)	PARTIAL	Delivery exists; pure point-to-point courier flow needs adding
Taxi / ride-hailing + timing	NO	Enatega is delivery-only. Passenger taxi with fares/timing must be built.
Flat weekly subscription fee	NO	App is commission-based. Your model must be built from scratch.
Auto-suspend on unpaid fee	NO	Does not exist. Core to your model.
Cash reconciliation flow	PARTIAL	'COD' label exists; real cash handling does not
Caribbean payment rails	NO	Only Stripe/PayPal; no PowerTranz/FAC/WiPay/MMG
Home-screen advertising	PARTIAL	Banner model exists; ad-sales/placement logic needs building

The honest headline

You have roughly 90% of a delivery platform already built and Guyana-branded. The missing ~10% is exactly the part that makes it YOUR business: (1) the flat-fee subscription + auto-suspend engine, (2) cash + Caribbean payment rails, (3) taxi with timing. The good news: the hard, boring 90% is done. The work ahead is focused and finite.

Note on IP & the earlier exit discussion: the platform is MIT-licensed open-source (Enatega by Ninjas Code). You may legally use, modify and sell it, but you must keep their copyright notice, and you do NOT own the foundational code — only your modifications. Your defensibility is your market position and network density in Guyana/Caribbean, NOT the software. Any acquirer's due diligence will see the open-source base immediately. Plan the moat around the business, not the code.
